

One Skill, Three Platforms

Building once, testing everywhere

The Core Idea

Because SKILL.md is an open format, the same file can be tested across multiple AI tools — but behavior isn't always identical everywhere.

Build It

1. Build and fully test the skill in Claude first.
2. Copy the same SKILL.md into a second supporting platform.
3. Run the identical test case in both places.
4. Note where the output differs — most gaps are formatting, not logic.

MOST GAPS ARE COSMETIC

When a skill behaves differently across platforms, check formatting and file handling first — the underlying instructions usually still hold.

Platform support for open-standard skills is still expanding. If you're watching this a while after it was made, DM me and I'll send the current list.
