

Prognostic value of the molecular subtypes of Breast Cancer

RESULTS FROM A DBCG STUDY

The Prosigna ROR score more accurately estimated the probability of 10-year distant recurrence in this population compared with the risk stratification provided by other gene panels²

The discordance between IHC-based subtype and Prosigna molecular subtypes is considerable; errors in assigning subtype can significantly affect breast cancer treatment efficacy.³

Prosigna is the only standardized assay for identification of the intrinsic molecular subtypes of breast cancer (Luminal A, Luminal B, HER2-enriched and Basal-like).³

DR: Distant Recurrence. IHC: Immunohistochemistry.

More comprehensive information for better treatment decisions

Prosigna[®]
BREAST CANCER ASSAY

Prosigna[®]
BREAST CANCER ASSAY

2nd generation test that more comprehensively informs treatment decisions

Provides more accurate prognosis which is the foundation of treatment recommendations¹

Prosigna[®] combines tumour gene expression and clinico-pathological factors in a single 10-year Risk of distant Recurrence (ROR) score^{4,5}

The only breast cancer prognostic test identifying the four PAM50 molecular subtypes

Easy access to local testing with faster turnaround times

CE-IVD MARKED

A local solution with more comprehensive information and fast and efficient turnaround time when patients cannot afford to wait

Your local lab and trusted pathology team can deliver sophisticated genomic analysis

The Prosigna assay reports three key pieces of information specific to your patient:

1. Molecular Subtype (Luminal A, Luminal B, HER2-enriched, Basal-like)
2. Risk of Recurrence (ROR) Score
3. Risk Group (Low, Intermediate, High)

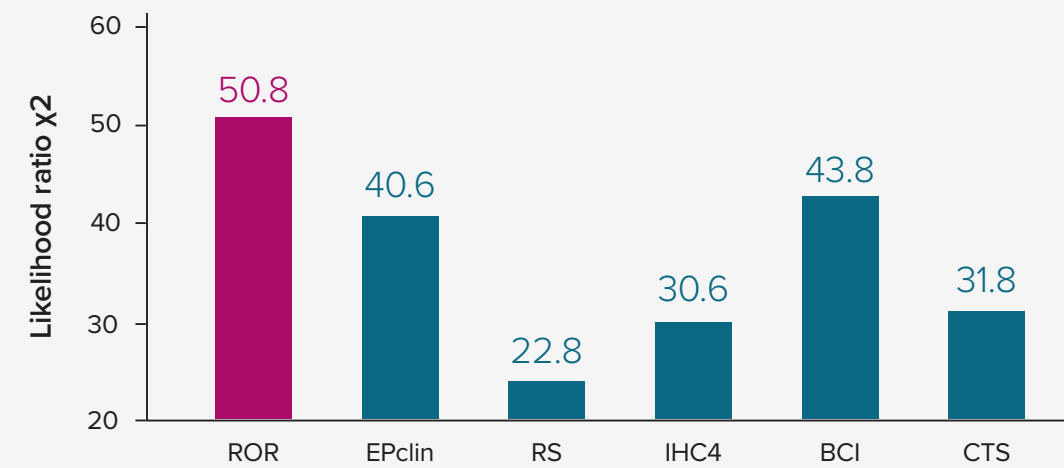

*This graph is specific for Node-negative patients. Please see full product insert for details for Node-positive patients. CI: confidence interval, FFPE: Formalin-Fixed Paraffin-Embedded, HER2: human epidermal growth factor receptor 2, RNA: Ribonucleic Acid, ROR: Risk of Recurrence Score.

Prosigna® provides the most prognostic information in node-negative patients¹

RESULTS FROM A TRANSATAC STUDY

A higher likelihood ratio χ^2 * indicates a higher prognostic test performance

COMPARATIVE PERFORMANCE OF GENOMIC SIGNATURES - YEARS 0 TO 10

COMPARATIVE PERFORMANCE OF GENOMIC SIGNATURES - YEARS 5 TO 10

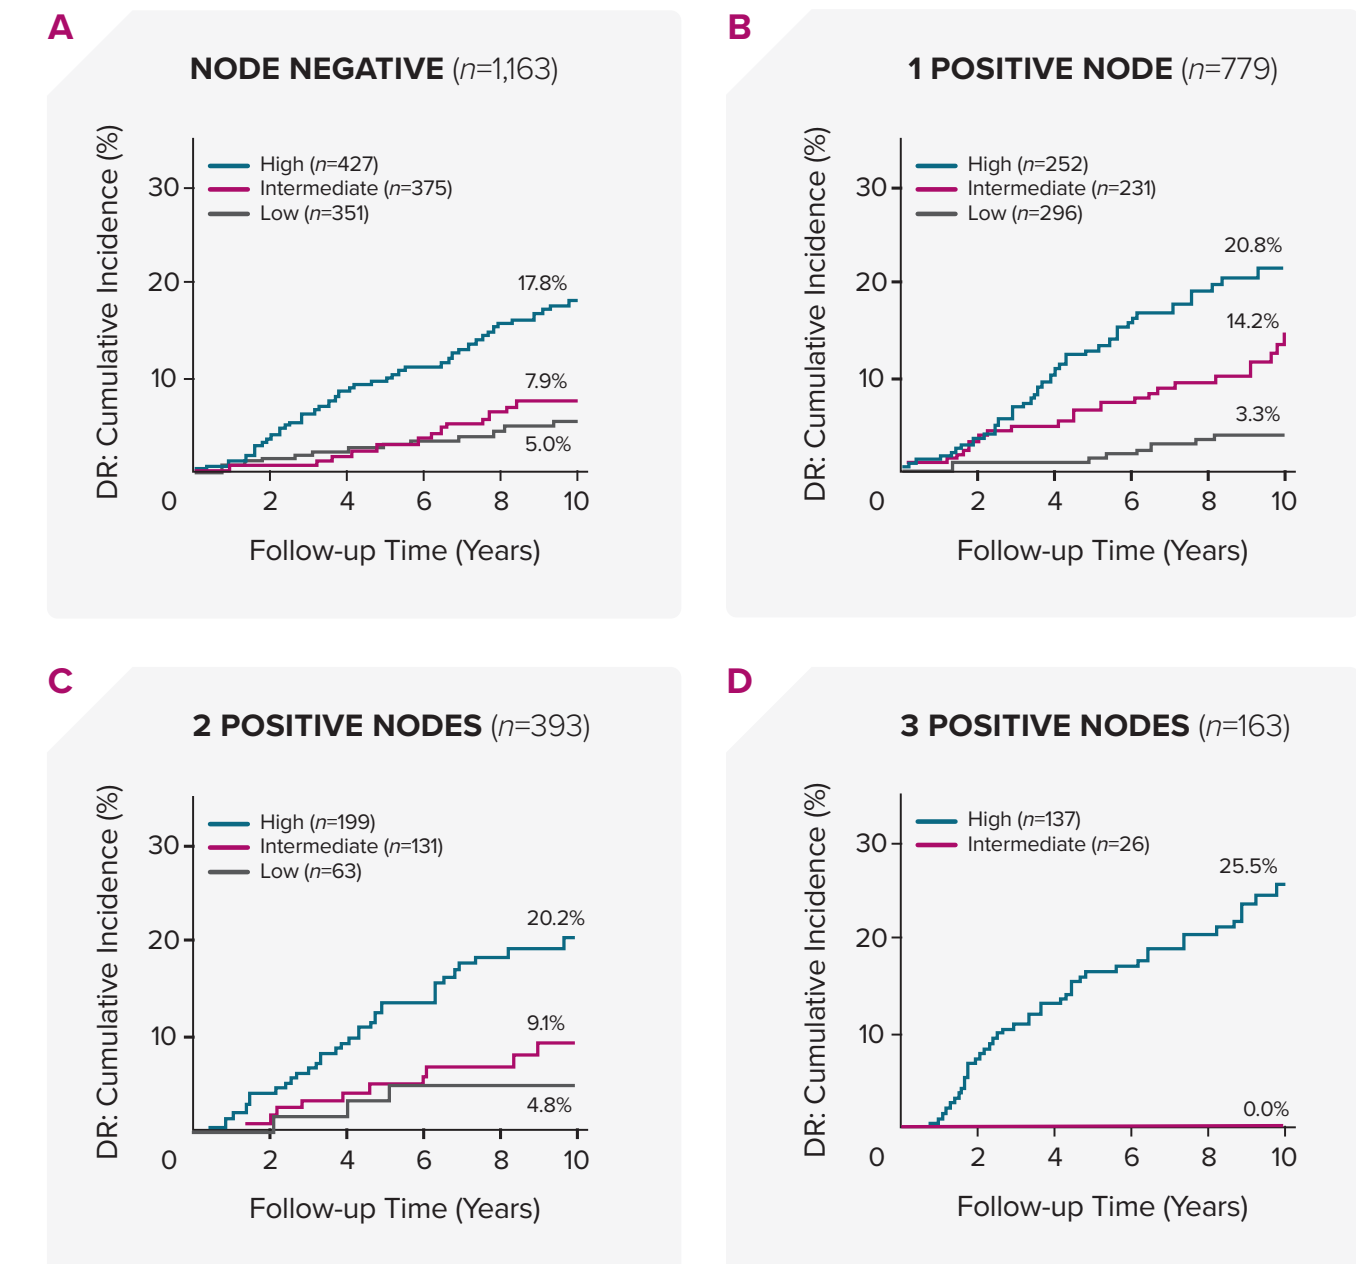

Prosigna outperforms the leading first generation test and the other 2nd generation test, from 0 to 10 years and for late recurrence. "For women with node-negative disease, the ROR, followed by BCI, and EPclin were significantly more prognostic for overall and late distant recurrence." - Dr. Ivana Sestak¹

*The likelihood ratio χ^2 is a statistical measure that is used to compare the performance of different tests. BCI: Breast Cancer Index, CTS: Clinical Treatment Score, EPclin: EndoPredict clinical, IHC4: Immunohistochemical Score, ROR: Risk of Recurrence Score, RS: Recurrence Score.

Prosigna® accurately identifies node-positive patients of low-risk group with favourable outcomes regardless of nodal status²

RESULTS FROM A DBCG STUDY

All patients categorized as low-risk by the Prosigna Breast Cancer assay, regardless of nodal involvement status, have a distant recurrence absolute risk below or equal to 5%²

DR: Distant Recurrence.
